Architecture Summary

InterviewAce follows a 5-layer architecture that separates concerns across the UI, application logic, core services, data persistence, and infrastructure. The system uses FastAPI backend with React frontend. AI scoring and feedback are powered by sentence-transformers (cosine similarity) and deterministic rubric evaluation. Emails are sent via Brevo SMTP service. Data is stored in PostgreSQL. The application is containerized with Docker and the codebase is managed in GitHub with CI/CD using GitHub Actions.
